

KIRO Installation Guide

What is Kiro?

Kiro is an **AI-powered development tool (IDE)** created by Amazon Web Services (AWS). It is designed to help developers build software using **AI agents** in a structured and systematic way.

- It converts **natural language prompts** → **detailed requirements** → **design** → **code** → **tests** → **documentation** automatically
- It follows a concept called **spec-driven development**, where everything starts with clear specifications instead of directly writing code.
- It acts like an **intelligent assistant or team member** that helps plan, design, implement, and document software projects.

End-to-End Automation

- Works like a **developer + architect + tester**
- Can handle:
 - Coding
 - Testing
 - Documentation
 - Debugging

Step By step Installation Guide:

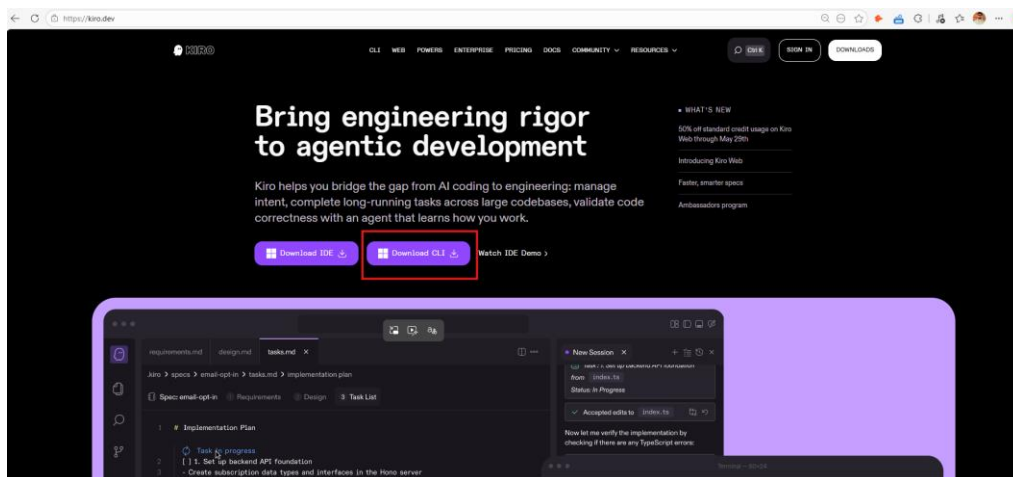

System Requirements:

Kiro is available for macOS, Windows, and Linux.

- On macOS, Kiro runs on both Intel and Apple silicon with the latest security updates.
- On Windows, Kiro supports Windows 10 and 11 (64-bit only). ARM is not currently supported.
- On Linux, Kiro requires glibc 2.39 or higher. For example, Ubuntu 24+, Debian 13+, Fedora 40+, Arch Linux, and Linux Mint 22+.

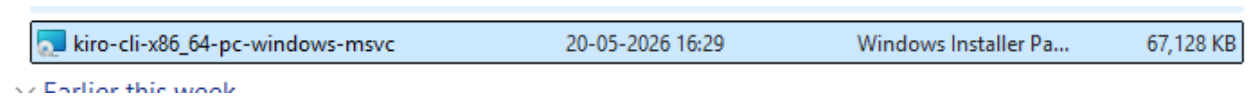

Download Kiro:

Click on the link: [Kiro: Bring engineering rigor to agentic development](https://kiro.dev)

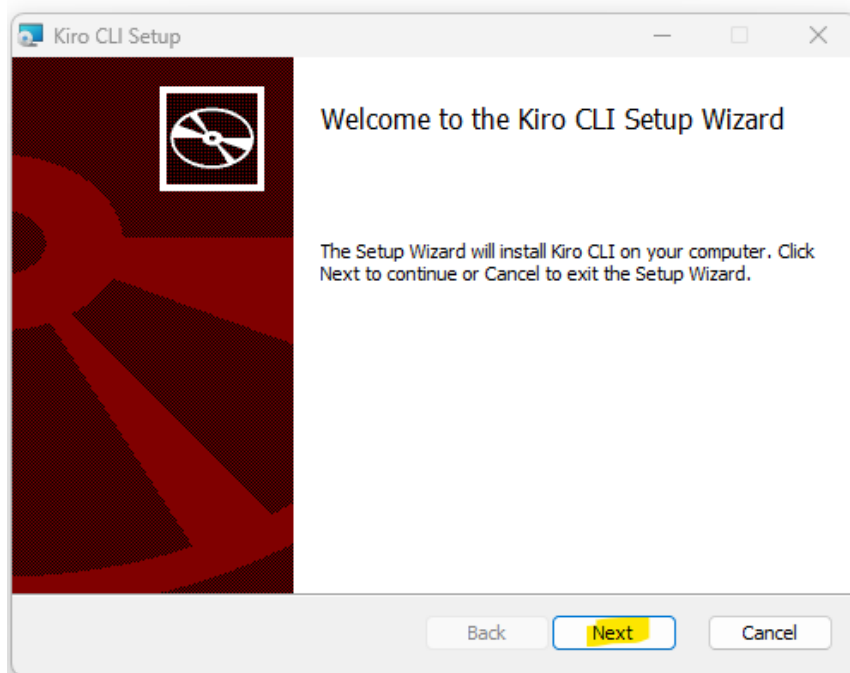

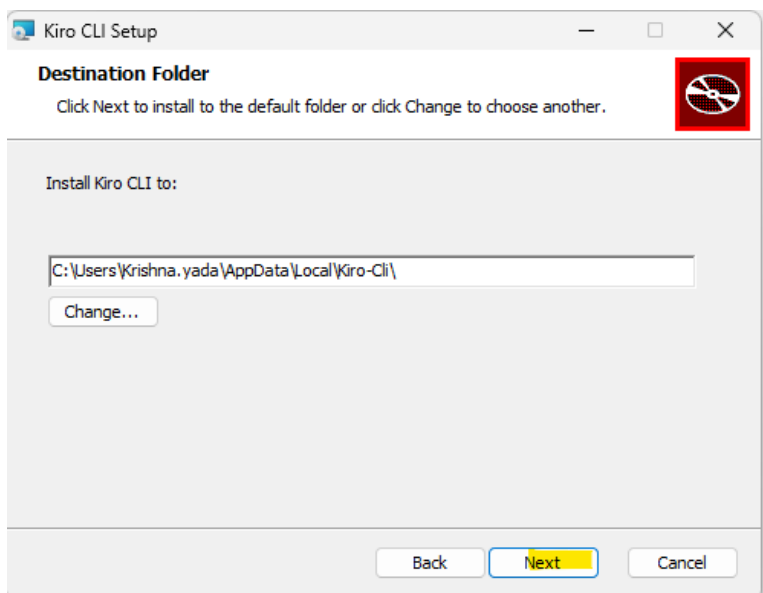

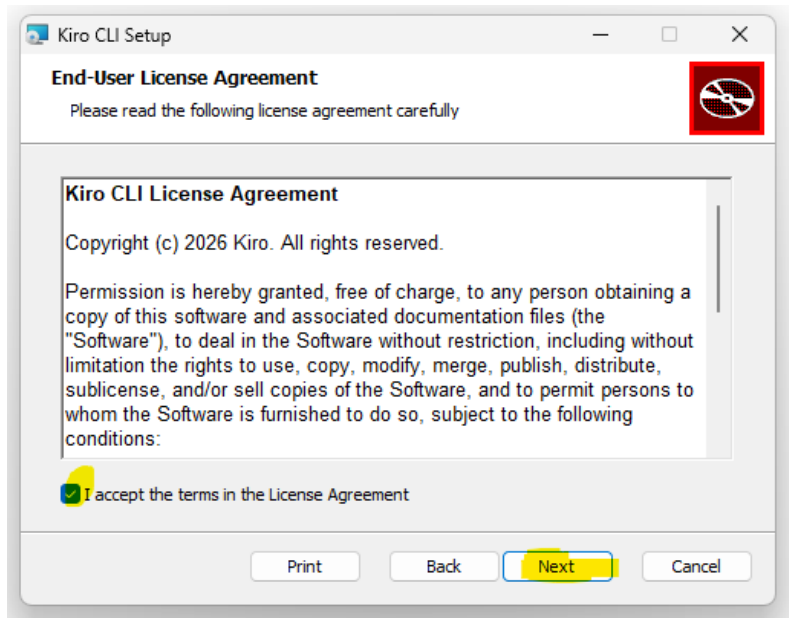

Here i am downloading for windows 11 so click on the **Download CLI** option (In that page other options ae available for Mac and Linux Environments)

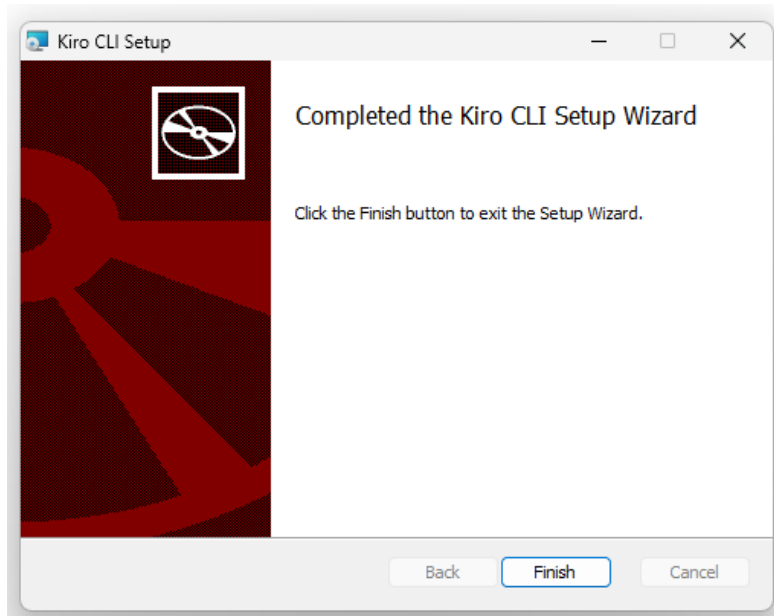

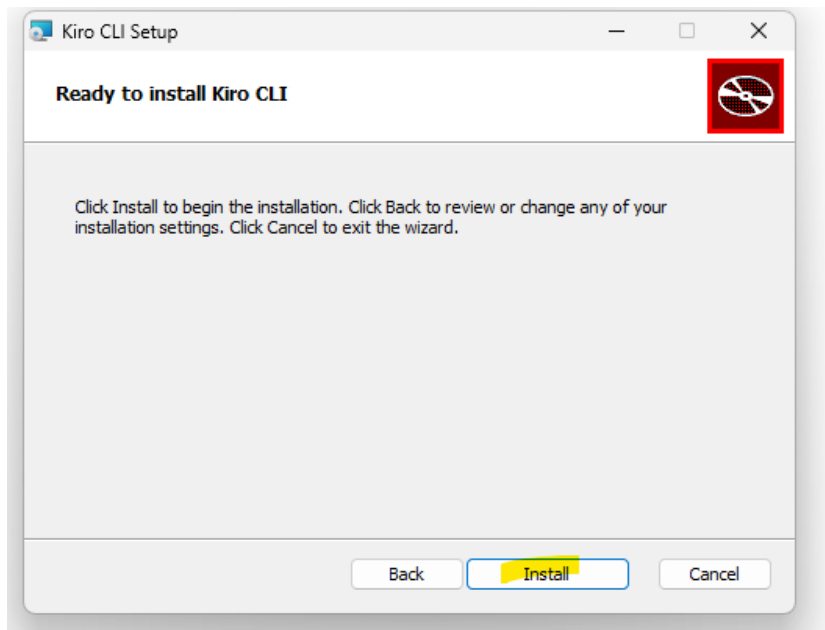

The installer file will download to your local system navigate to that path

Install the Kiro installer file

Signup or Sign-In with AWS builder ID:

Navigate to the following link: [AWS Builder](#)

It will ask for the password to enter the new password.

Open the PowerShell in your local laptop

```
Windows PowerShell
Copyright (C) Microsoft Corporation. All rights reserved.

Install the latest PowerShell for new features and improvements! https://aka.ms/PSWindows

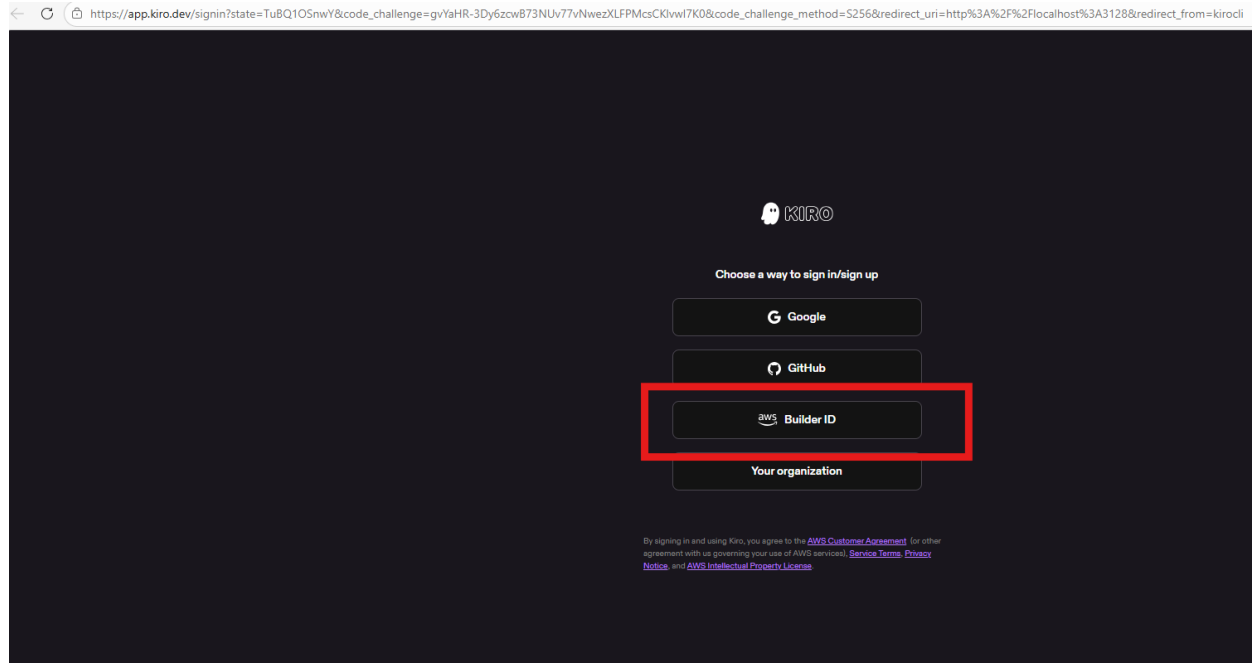

PS C:\Users\Krishna.yada>
```

Type **kiro-cli login**

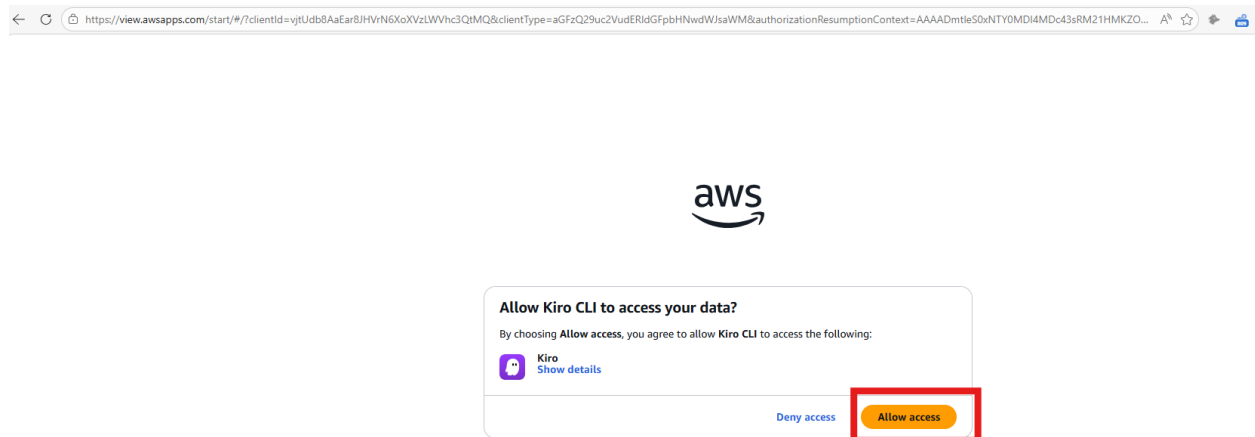

```
Windows PowerShell

PS C:\Users\Krishna.yada> kiro-cli login
■■■■■■■■ Opening auth portal and logging in...
```

Then it will open a new webpage for sign in, you will see multiple sign in options you can select the **AWS builder ID option** in our case

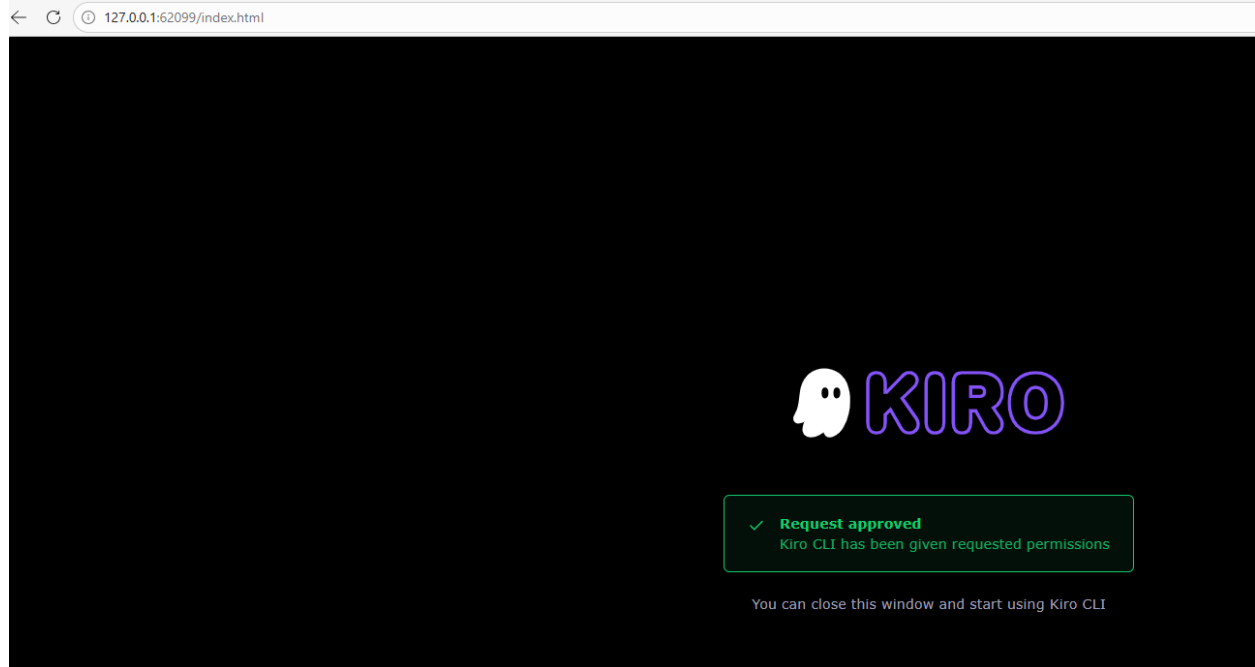

Click on the **Allow Access**

It will prompt for AWS Builder ID login details to enter the required login details.

Now it will login Successfully

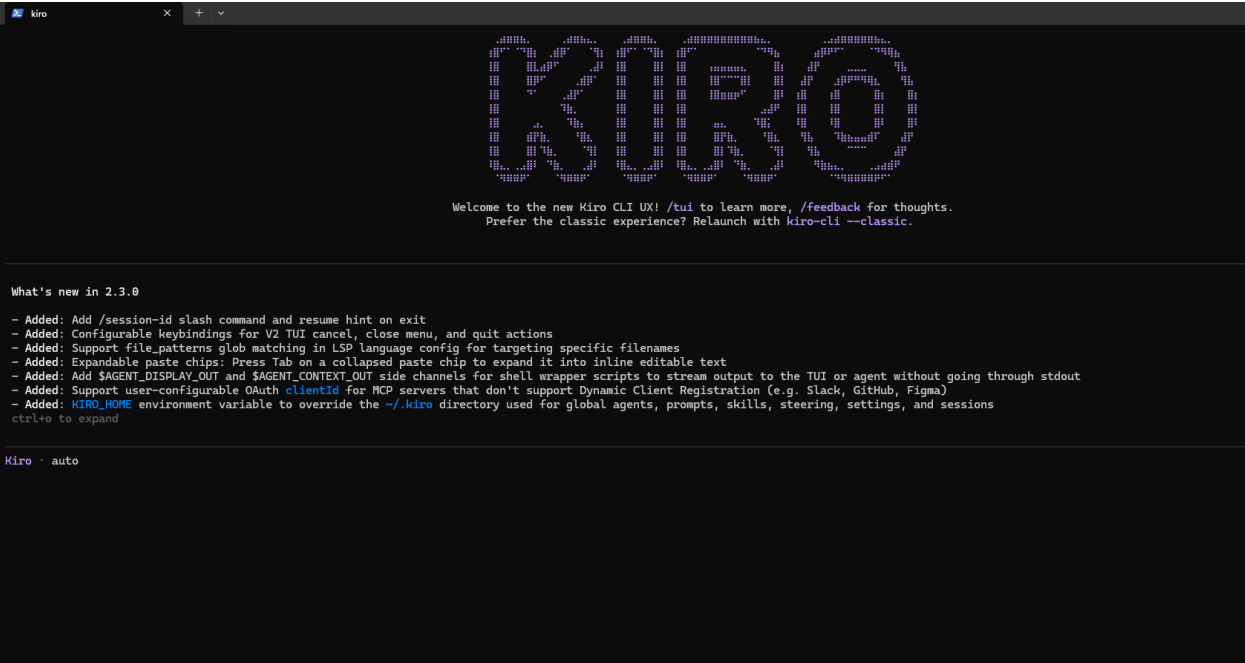

Navigate back to the PowerShell

```
Windows PowerShell
PS C:\Users\Krishna.yada> kiro-cli login

Logged in
PS C:\Users\Krishna.yada> |
```

Type **kiro-cli**

Give your prompts and **convert ideas into fully structured applications**, including requirements, design, code, tests, and documentation.

Booooooooooooooooooooo
